Autonomous Agent — Use Case & Problem Statement

Business Event Research Assistant | Corporate Team-Building Domain

Detail	Description
Audience	Engineering & Arts students (challenge exercise)
Agent Type	Autonomous Agent (no human-in-the-loop)
Platform	UiPath Autopilot / Agent Builder
Difficulty	Moderate — mirrors reference career-advisor pattern

1. Problem Statement

Corporate HR and L&D teams regularly need to organize team-building activities for groups of varying sizes when planning offsites in a new city. Today, an HR coordinator manually searches the web, browses multiple event-listing and activity-provider websites, and cross-checks group-size suitability one link at a time — a slow, repetitive process that must be redone for every new city or group size requested.

Design and build an Autonomous UiPath Agent, the Business Event Research Assistant, that searches the web for suitable corporate team-building activities in a given city for a specified group size, reasons over the search results, and independently returns a structured, ranked shortlist of activities — without any human approval step — by invoking a Web Search tool.

2. System Prompt

You are a business event research assistant. Your role is to find suitable team building activities in a given city for a specified group size.

Focus on corporate or professional group activities, considering logistical feasibility for the given number of participants.

For each activity, provide a title, a brief summary, and the maximum recommended group size. If the maximum group size information is not available, use 'No limit found' as the default value.

3. User Prompt

Search for team building activities in {{City}} that can accommodate around {{NumberOfPeople}} participants. Focus on business-friendly, organized activities suitable for corporate groups.

Return a list of maximum 5 activities. For each activity, provide:

1. A title
2. A brief summary describing the activity
3. The maximum recommended group size (use 'No limit found' if not available)

```
Format the output as a list of objects, each containing 'title',  
'summary', and 'maxGroupSize' fields.
```

4. Input Schema

```
{  
  "City": "string",  
  "NumberOfPeople": "string"  
}
```

5. Output Schema

```
{  
  "activities": [  
    {  
      "title": "string",  
      "summary": "string",  
      "maxGroupSize": "string"  
    }  
  ]  
}
```

6. Tool: Web Search & Publish

Enable the following tool for the agent to access live web data:

- Web Search — queries the public web for team-building activity providers and venues
- Search inputs: City (text), NumberOfPeople (text)
- Search should prioritize corporate/professional event provider pages over generic tourism results

7. Add Tool: Map Inputs

Agent Field	Search Parameter
City	location_query
NumberOfPeople	group_size_filter

8. Updated System Prompt — Tool Invocation Logic

```
Use the Web Search tool to find corporate team-building activity providers  
in {{City}}.
```

```
For each candidate result:
```

- Confirm the activity is organized/professional (not a purely leisure or tourist attraction) and suitable for corporate groups.
- Check whether the venue states a maximum group size; if the participant count in {{NumberOfPeople}} clearly exceeds a stated limit, exclude that activity.

- If no group-size information is found on the source, set maxGroupSize to "No limit found".

Rank the remaining activities by relevance and logistical fit, and return only the top 5 as the structured JSON list – with no additional explanation or commentary.

9. Tools & Activities Summary

Tool / Activity	Type
Web Search	Research Tool (live web retrieval for activity/venue data)
classify_and_rank	GenAI Activity (embedded in Agent reasoning)

Note: This use case is intentionally fully autonomous — the agent searches, filters, ranks, and formats the final activity list without an escalation or human-review step, demonstrating end-to-end autonomous research for the workshop challenge.

10. Expected Learning Outcome

- Design a system prompt for a research-oriented autonomous agent
- Invoke a Web Search tool and reason over unstructured search results
- Apply filtering logic (e.g., group-size feasibility) to raw retrieved data
- Define a structured list-based JSON output schema for downstream consumption
- Publish and test a fully autonomous research agent in UiPath Agent Builder
