UiPath Platform Overview

Studio Web Interface

Building Your First Workflow

Live Demo

Q & A

	UiPath Studio	Studio Web	Studio X
Access	Windows desktop install	Any browser, any OS	Windows desktop install
Best for	Complex, enterprise automations	Quick browser-based automations	Business users, low-code
Setup	Download & install required	None — just sign in	Download & install required
Coding depth	Full — code, .NET, custom	Low-code, browser-native	No-code, guided

What is UiPath Studio Web?

- A browser-based, low-code environment for building automations — no installation required.
 - Runs entirely at studio.uipath.com, tied to your Orchestrator tenant.
 - Designed for fast, simple, guided automation creation using natural-language and drag-and-drop building.
 - Automatically saves your work to the cloud as you build.
 - Ideal for students and beginners — perfect environment for today's first workflow.
- 

Why Start With Studio Web?

UiPath Community

1

Zero Install

Open a browser and sign in — works on any OS, including Chromebooks and labs.

2

Guided Building

Descriptive recorder and activity suggestions guide beginners step by step.

3

Cloud-Native

Auto-saves, versions, and publishes directly to Orchestrator.

4

Team-Friendly

Share and co-edit processes without exchanging files.

Getting Access to Studio Web

- Sign up for a free UiPath Automation Cloud account at cloud.uipath.com
- Navigate to the Studio Web tile from the Automation Cloud home page.
- Requirements:
 - A modern browser — Chrome or Edge recommended.
 - A stable internet connection (all work happens in the cloud).
 - No local installation, licences, or admin rights needed.

Testing and Debugging in Studio Web

- Click Run at the top of the canvas to execute your workflow step by step.
- Studio Web highlights the currently executing activity in real time.
- Use breakpoints to pause execution and inspect variable values.
- The Output panel shows logs, errors, and any Log Message activity text.
- Common first-run issues:
 - Selector not found — the page may not have fully loaded yet.
 - Wrong variable bound to the wrong field — recheck Type Into properties.

Publishing and Running Your Robot

- Once testing passes, click Publish in the top-right corner.
 - Choose a version number and target Orchestrator folder.
 - Studio Web packages your process and uploads it automatically.
 - From Orchestrator, trigger the process manually or attach it to a Trigger/Schedule.
 - Your robot can now run unattended — no Studio session required.
- 

Best Practices for Beginners

UiPath Community

Name everything clearly

Workflows, variables, and arguments — future you will read these again.

Prefer waits over delays

"Wait for element" is far more reliable than a fixed-time Delay.

Handle errors gracefully

Wrap risky steps in Try Catch so one failure doesn't crash the run.

Comment your logic

Use annotations to explain "why", not just "what".

Test on real data early

Sample data hides edge cases that real inputs will expose.

Keep workflows small

Break large processes into reusable, testable sub-workflows.

Resources to Keep Learning

- UiPath Academy — free, self-paced courses at academy.uipath.com
- UiPath Forum — community Q&A at forum.uipath.com
- Official Documentation — docs.uipath.com/studio-web
- Practice by automating one small repetitive task in your own daily routine
